F5, by Lance Spencer

Lance was quite a good speaker, engaging with everyone in the chat and hosting a lot of knowledge. He talked a lot about infrastructure and how F5 is a ADN (not a CDN), which means that they are an Application Delivery Network. F5 gear is in approximately 50% of the world's internet infrastructure, which is a pretty hefty boasting right. Even more impressive though, is that they have never had a data breach. They heavily push for keeping their customers data secure as well, not even disclosing their customer base.

I honestly really enjoyed listening to Lance's presentation since he actually talked about what the company does and what it's like to work there. There weren't any company ads or recruitment speeches, which was also very nice. Believe it or not, this style of presentation makes me want to work there more than the other companies, since he seems more prepared to speak, and more confident, competent, and knowledgeable about his company. I do wonder, what is it like to have the pressure of half the world's infrastructure? Has there been any outside pressure from governments to release user data? And what is it like to be a global company with a part in most countries?
